

ActiveBoost — Product Demo Video Script

Runtime target: ~3 minutes. Tone: confident, fast-paced SaaS demo (think Linear/Stripe launch videos).

SCENE 1 — Hook (0:00–0:10)

Visual: Black screen → dumbbell logo pulses in (orange→violet gradient) → wordmark "ActiveBoost" snaps in. **VO:** "Running a gym means juggling members, payments, trainers, and inventory — across five different tools. ActiveBoost replaces all of them with one."

SCENE 2 — Problem (0:10–0:20)

Visual: Split screen — messy spreadsheet, WhatsApp chat, paper attendance register, separate payment app — all flashing red X's. **VO:** "Spreadsheets for members. WhatsApp for support. Cash registers for payments. None of it talks to each other."

SCENE 3 — Architecture overview (0:20–0:40)

Visual: Clean animated diagram, left to right: `Browser (Next.js)` → `REST API (NestJS)` → `PostgreSQL` with a branch down to `Razorpay` and `Socket.io (live chat)`. **VO:** "ActiveBoost is one platform: a Next.js dashboard talking to a NestJS backend, Postgres underneath, real payments through Razorpay, and live chat built in. Five roles, one source of truth."

SCENE 4 — Role tour (0:40–1:20), ~8 sec per role, dashboard screen-recordings

1. **Super Admin** — platform-wide gym list, revenue, subscription plans. *"Platform owners see every gym, every dollar, from one screen."*
2. **Gym Admin** — members grid, payments table, supplement inventory. *"Gym owners run the whole business — members, staff, trainers, stock — without leaving the dashboard."*
3. **Trainer** — assigned members, PT session calendar, performance ring. *"Trainers see their schedule and their numbers, not someone else's spreadsheet."*

4. **Staff** — check-in flow, leave requests. *"Staff clock in, request leave, done."*
5. **Member** — supplement store, membership card, chat with gym. *"Members shop, pay, and message the gym — all in the app they already opened to check their plan."*

SCENE 5 — The payment flow, in detail (1:20–2:00)

Visual: Step-by-step animated sequence, screen-recording cut with diagram overlays:

1. Member taps "Buy" on a supplement.
2. Backend computes the real price server-side (overlay text: *"price never trusted from the browser"*).
3. Razorpay checkout opens — real payment, test mode shown.
4. Payment completes → signature verified server-side.
5. Order auto-confirms, stock decrements, admin's order list updates live. **VO:** "Every payment is priced and verified on the server — never the browser. The moment Razorpay confirms it, the order is created, stock is deducted, and the gym admin sees it instantly. No manual reconciliation."

SCENE 6 — Live chat (2:00–2:15)

Visual: Two windows side by side — member sends a message, admin's screen updates in real time with no refresh. **VO:** "Built-in chat means support tickets, schedule changes, and quick questions never leave the platform."

SCENE 7 — Under the hood, for technical viewers (2:15–2:35)

Visual: Code editor flash — Prisma schema, a controller file, the event-emitter listener pattern. **VO:** "Role-based access on every endpoint. Event-driven side effects — one payment event can trigger order fulfillment, commission calculation, and notifications, independently. Migrations tracked, typed end to end."

SCENE 8 — Close (2:35–3:00)

Visual: Quick montage of all 5 dashboards cutting fast, then back to logo. **VO:** "One login. Every role. Real payments. Real time. ActiveBoost — run your gym like a pro." **End card:** Logo + tagline + URL.

Shot list / asset checklist

- ☐ Screen recordings: super-admin dashboard, admin members/payments/supplements, trainer dashboard, staff check-in, member supplements+membership+chat
- ☐ Architecture diagram animation (can reuse the Mermaid-style boxes from the generation prompt given earlier)
- ☐ Payment flow animated sequence (5 steps above)
- ☐ Two-window live chat side-by-side recording
- ☐ Code editor close-ups (schema.prisma, payment-events.handler.ts)
- ☐ Logo animation (intro + outro)

Voiceover full text (for TTS or recording, ~95 sec read at normal pace)

Running a gym means juggling members, payments, trainers, and inventory — across five different tools. ActiveBoost replaces all of them with one. Spreadsheets for members. WhatsApp for support. Cash registers for payments. None of it talks to each other. ActiveBoost is one platform: a Next.js dashboard talking to a NestJS backend, Postgres underneath, real payments through Razorpay, and live chat built in. Five roles, one source of truth. Platform owners see every gym, every dollar, from one screen. Gym owners run the whole business — members, staff, trainers, stock — without leaving the dashboard. Trainers see their schedule and their numbers, not someone else's spreadsheet. Staff clock in, request leave, done. Members shop, pay, and message the gym — all in the app they already opened to check their plan. Every payment is priced and verified on the server — never the browser. The moment Razorpay confirms it, the order is created, stock is deducted, and the gym admin sees it instantly. No manual reconciliation. Built-in chat means support tickets, schedule changes, and quick questions never leave the platform. Role-based access on every endpoint. Event-driven side effects — one payment event can trigger order fulfillment, commission calculation, and notifications, independently. Migrations tracked, typed end to end. One login. Every role. Real payments. Real time. ActiveBoost — run your gym like a pro.
